***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Art Unit: 1792

5. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Japanese Patent Abstract (JP-03 040 987A).

JP-03 040 987A teaches a vertical or horizontal Bridgman method for the production of GaAs single crystals and to enhance the yield of a raw material by specifying the shape of the utilized seed crystal in a crystal growing method. The process teaches that the crucible used has an upper portion with a constant diameter and a lower increasing portion; the seed crystal in the lower portion grows upwards. The angle is less than 35°.

The difference being that JP-03 040 987A does not teach a seed crystal with an Average dislocation density of less than 10,000 dislocations/cm<sup>2</sup>. with a diameter of at least 50 mm. However, in the absence of unobvious results, it would have been obvious to one of ordinary skill in the art to determine through routine experimentation the optimum, operable process parameters in order to ensure proper orientation.

A reference is good not only for what it teaches by direct anticipation but also for what one of ordinary skill might reasonably infer from the teachings.
